

PRODUCT DATA SHEET

PRODUCT : **AIRBLISS™ AIR FRESHNER LIQUID**

VERSION No. : **2.0**

DATE: **23-10-2025**

Mal odor causes problems in regard to both health and aesthetics. Removal of malodors is a prerequisite to successful tourist trade, pleasant dining, and the perception of cleanliness in hospitals and clinics and in providing a generally healthy atmosphere.

Odors are produced by the action of certain volatile compounds on the olfactory system. Typical organic odors generated by wastes are listed below:

Compound	Odor characteristics	Odor threshold (mg/N m ³ air)
Hydrogen Sulphide	Rotten Egg	0.0001-0.03
Ammoniac	Very pungent, irritating	0.5-0.37
Indole	Fecal, nauseating	0.0006
Scatole	Fecal, nauseating	0.000008-0.10

Methods of malodor control may involve several basic mechanism:

1. Overwhelming the olfactory system with more potent fragrances that mask the malodor
2. Reacting with malodorous compounds to change them into non odorous or good odor compounds
3. Anesthetizing the olfactory system with chemicals
4. Reacting with malodorous compounds to prevent their volatilization
5. Microbiological breakdown of malodorous compounds into simpler compounds that do not have any odor

We have concentrated our efforts on developing a product that manages / removes malodor by the 1st and 5th mechanism. As one of the major players in developing microbiological technology for environmental applications, we have developed a product named **AIRBLISS™ AIR FRESHNER LIQUID** to manage malodor in toilets.

AIRBLISS™ AIR FRESHNER LIQUID is a ready-to-use non-pathogenic bacterial consortium adept in malodor management and various commercial fragrance. Microbial enzymes work synergistically by decomposing the malodor compound. Simultaneously fragrance is released in the environment.

To achieve sustained release of the fragrance over longer period, polymer nanotechnology was applied to the product using a naturally available biopolymer. The entrapment of the fragrance molecules on this biopolymer nanoparticles ensures the slow release of the fragrance molecules over a sustained period of time. This makes the fragrance lasts for 12 hours on a single application.

Additional applications of this product include garbage chutes, dirty linen collection areas, subways, public restrooms, kitchen floors, around dumpsters, animal cages and containment areas and diaper pails.

Benefits:

- Degrades and eliminates wide range of malodor generating compounds
- Highly effective, broad spectrum organic and inorganic degradation capabilities
- Deep penetrating capabilities
- Long lasting fragrance up to 12 hours

Application Conditions:

1. Malodor control in Municipal solid waste management.
2. Dumper trucks Malodor treatments used for transportation of Municipal solid waste.
3. Garbage bin treatments.
4. Odor management in Piggery, poultry, zoo's, kennels etc.
5. Washrooms in institutional, public transport and places.
6. A dosage of 25 mL for 50 sq. ft. (or 50 mL for 100 sq. ft.) delivers a noticeable fragrance that lasts for up to 8 hours.

Storage Conditions & Packaging:

AIRBLISS™ AIR FRESHNER LIQUID storage

- Temperature range is 0°C to 40°C.
 - Humidity range - all.
 - It should be kept original container with closed lids.
- **AIRBLISS™ AIR FRESHNER LIQUID** is available in 05Kg Cans.
