

PRODUCT DATA SHEET

PRODUCT	:	BREWSTABAID PSEP	
VERSION No.	:	2.0	DATE: 04-03-2026

Introduction:

During maturation of beer in UT/CCFV, complex protein and polyphenol precipitation has been shown to be the result of hydrogen bonding between the polyphenols and the proline-rich fraction of particular polypeptides. This haze develops over time and, initially, is reversible (haze disappears when the temperature of the beer increases). As the hydrogen bonding becomes stronger this chill haze can become permanent.

BREWSTAB AID PSEP is a product containing an endo-protease which cleaves polypeptides at the carboxyl end of the amino acid proline. It is standardized at a minimum of 22 PU per mg.

BREWSTAB AID PSEP will prevent the precipitation of complexed polyphenols and proteins. This is done by hydrolyzing the sensitive (haze-active) polypeptides in the region where such hydrogen bonding occurs. The enzyme PSEP ensures in beer no other parameters are affected.

Benefits:

- BrewstabAid PSEP enables direct Cost saving due to refrigeration Energy in chilling beer to 2°C as against normal beer stabilisation temperature of -1°C.
- BrewstabAid PSEP ensures Colloidal stability of the finished beer for up to one year.

Application Conditions:

- Dose rate of 1 - 2 g /HL beer.
- Add to cold wort free from large suspended particles, acidic environment at the start of the fermentation.

Storage Conditions and Packaging:

- BrewstabAid PSEP - ideally STORED at temp 10°C. Transport conditions at room temperature.
- It is best if used before 18 months from date of manufacturing.
Note: Please note that recommended storage conditions must be strictly followed.
- It is available in 25 KGs HDPE cans.

All our products, conform to the standard FSSR, 2011 (The food safety and standard regulation, 2011 as amended by regulations, 2016). FSSAI LICENSE NUMBER – 10015043001372.
